Project ID#

Q1: Research Question/Engineering Go

Did 80% of people surveyed significantly change their daily and recreational activities during the Covid pandemic?

Q3: Data Analysis & Results

55 percent of people said that the COVID-19 pandemic did have a major impact on their lives which is the majority and 80 percent of people said that they have becomes less active and less determined to do work that needs to be done since the pandemic.

Q2: Methodology/Project Design

First you make the quiz through a pdf and make it all multiple choice and have questions surrounding the things such as how they were affected and the activities they participated in before the pandemic and also there attitudes towards the whole thing, Then find a group of people all in the same demographic and email the quiz to them and explain to them that it is a blind survey and that their answers will not be seen then collect the results.

Q4: Interpretation & Conclusions

I said No 80% of the people surveyed did not significantly change their daily recreational activities because judging by my experiences people spend most of their time at home except for when they went to work or the store. However that hypothesis was not supported because 80 percent of people have become sedentary and 55 percent of peoples recreational activities were affected causing them to become less determined. Next time I would have a bigger sample size and also more questions that would be worded differently, so people could maybe understand them better.
